DETAILED ACTION

Drawings

1. The drawings are objected to because of minor informalities in the lettering size and the hand lettering and hand drawn numbers and figures including the hand draw elements of figures. Figure 2 does not have the correct word labeling for the identification of each block and the corresponding function for each block. Figures 1 to 5 are of poor quality and are not clear as required in 37 CFR 1.83 (a). A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Prior Art

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

I. Art A of Jurisch et al., US 6,104,182 in class 324/142 is cited for the method of deriving a signal indicating from current and space vectors that are formed from current and phase voltage sampling values of an electrical power system to provide a method for obtaining an oscillation signal used to detect higher frequency oscillations in electrical power supply systems by forming quotients with a measured current quality of the positive sequence system using the squaring elements 12 and estimator circuits 14 in figure 1 using the current and space vectors in line 10 of column 3.

Art Unit: 2863

II. Art B of Yamaura US 4,591,992 in class 702/059 is cited for the method of identification of the direction of a fault in a power line using vectors V_k with sample values of the voltage potential at time points and sample current flow components at intervals equal to the multiple of half times of the system frequency to provide protection in the direction of the protection zone to determine voltage vectors V_k and current vectors I_k in figure 1 with summation numbers 3 reached in figure 2 to provide direction identification in lines 55-65 of column 1.

Allowable Subject Matter

3. Claims 1—11 are allowed.

4. The following is an examiner's statement of reasons for allowance: The prior art of record does not suggest or disclose the claimed combination of method steps, most particularly the claimed "forming impedance values from the phase current and phase voltage sample values...[and] monitoring the impedance values for an oscillation using an oscillation model" or the particularly claimed steps of impedance values formed as a variable dependent on the impedance values differ from the oscillation" or the particularly claimed steps of an occurrence of other impedance values of a variable dependent on the impedance values which differs from the oscillation model" used to determine if the oscillations have stopped is not found in the cited art of record.

Claims 2-11 are dependent on the allowed independent claim 1 are allowed at least for the reason cited above.

Art Unit: 2863

The prior art A of Jurisch et al., US 6,104,182 teaches the method of deriving a signal indicating from current and space vectors that are formed from current and phase voltage sampling values of an electrical power system and teaches a method for obtaining the oscillation signal used to detect the higher frequency oscillations in electrical power supply systems by forming quotients with a measured current quality of the positive sequence system by using the squaring elements 12 and the estimator circuits 14 in figure 1 and teaches using the current and space vectors in line 10 of column 3 to indicate an oscillation and teaches determining these vectors from a center point of a circle of a curved path formed by the successive impedance values of the positive sequence system in line 25 of column 11.

The prior art B of Yamaura US 4,591,992 in class 702/059 the method of identification of the direction of a fault in a power line using vectors V_k and teaches the sample values of the voltage potential at time points and teaches the sample current flow components at intervals equal to the multiple of half times of the system frequency to provide protection in the direction of the protection zone used to determine the voltage vectors V_k and the current vectors I_k in figure 1 using the summation numbers 3 in figure 2 to provide the direction and the identification of signals in lines 55-65 of column 1.

Therefore, the prior art Jurisch et al., and The prior art of Yamaura in combination or alone does not teach the present limitation of the claimed combination limitation.

Art Unit: 2863

It is these limitations expressed in each of these claims and not found, taught, or suggested in the prior art of record, that makes these claims allowable over the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
